

Shinto

DevOps Engineer · Kubernetes Specialist

Profile Summary

Senior Platform / DevOps Engineer with **10 years** of experience in **Kubernetes administration**, **cloud infrastructure**, and **CI/CD automation** across blockchain, healthcare, and enterprise SaaS domains. Strong hands-on expertise running multi-region production workloads on **GKE**, **AWS EKS**, and bare-metal — including **50+ stateful services**, GitOps-driven deployments, and zero-downtime cutovers.

Deep practical knowledge of **Docker**, **Helm**, **Terraform**, and **Ansible** for containerized workload orchestration and infrastructure as code. Skilled at designing and operating **CI/CD pipelines** using **Jenkins (JCasC)**, **GitLab CI**, and **GitHub Actions**, with experience setting up these pipelines from scratch in organizations migrating to a DevOps culture.

Strong background in **Linux system administration**, **shell scripting**, and **Python automation**. Proven track record with observability stacks (**Prometheus**, **Grafana**, **Loki**, **ELK**), service discovery (**Consul**), and L7 routing (**Envoy Gateway**, **nginx**, **GCP Global Load Balancer**, **ingress controllers**). **Certified Kubernetes Administrator (CKA)**. Open to **US-timezone remote roles**.

Professional Summary

- Over **10 years** in **DevOps** and **Cloud Infrastructure Engineering** across production environments.
- Strong hands-on experience with **Kubernetes** administration and orchestration — operating multi-region clusters on **GKE** and **EKS**, plus self-managed clusters on bare-metal.
- Extensive experience with **Docker** and containerization — image build pipelines, multi-stage builds, container registries, and runtime troubleshooting.
- Designed and operated **CI/CD pipelines** using **Jenkins (JCasC)**, **Groovy DSL**, **GitLab CI**, and **GitHub Actions**. Comfortable bootstrapping pipelines for organizations new to DevOps practices.
- Production experience across **AWS**, **GCP**, and **OVH bare-metal**. **Azure** familiarity through observability and APM integrations.
- Strong **Infrastructure as Code** practitioner using **Terraform**, **Helm**, **Kustomize**, and **Ansible** — including modular Terraform across multiple environments and reusable Helm charts.
- Deep **Linux administration** and **shell scripting** (Bash); also **Python** for cluster automation and tooling against the Kubernetes API.
- **GitOps** end-to-end with **ArgoCD** and **ApplicationSets**, including progressive multi-region rollouts (RollingSync), drift handling (ignoreDifferences), and runbooks for the failure modes.
- Observability and monitoring with **Prometheus**, **Grafana**, **Loki**, and **ELK**; SLO-driven alerting, dashboards-as-code, and synthetic monitoring.
- Strong understanding of **networking**, **load balancing**, **ingress controllers** (**Envoy Gateway**, **nginx ingress**), and security best practices (extAuth, mTLS, RBAC, secrets management).

- Hands-on with **Git** and Git-based workflows — Gitflow, peer review, conventional commits, IaC-as-code review processes.
- Experience with **service discovery** across heterogeneous platforms — **Consul** federation spanning Kubernetes, Nomad, and bare-metal.
- Operated **stateful workloads at scale** — storage-layer recovery, snapshot-based rollbacks (**ZFS**, **GCP PD CSI**), and zero-downtime upgrades.
- Fix production bugs at the source and upstream them: merged PRs in **Erigon** (Ethereum execution client, Go) and **SGLang** (LLM inference server, CUDA/PyTorch).
- Comfortable with **incident response**, on-call, and root-cause analysis across the full stack — L7 routing, runtime, storage, and chain-client tuning.
- Experience working in **US time-shift remote** arrangements and globally distributed teams.
- Strong communicator with stakeholders — engineering leads, security, and product — for change coordination and incident review.

Technical Strength

- **Container Orchestration** — Kubernetes (CKA), Docker, Helm, Kustomize, Nomad
- **Cloud Platforms** — AWS, GCP, OVH bare-metal, Azure (familiarity)
- **IaC & GitOps** — Terraform, Ansible, ArgoCD, ApplicationSets
- **CI/CD** — Jenkins (JCasC + Groovy), GitLab CI, GitHub Actions
- **Observability** — Prometheus, Grafana, Loki, ELK, SLO-based alerting
- **Networking & Routing** — Envoy Gateway, nginx ingress, GCP Global LB, Consul, ingress controllers, L7 routing
- **OS & Scripting** — Linux administration, Bash, Python, Go
- **Version Control** — Git, GitFlow, peer-review workflows

Education

B.Tech in Computer Science & Engineering

Mahatma Gandhi University, Kerala

Certifications

- **Certified Kubernetes Administrator (CKA)** — The Linux Foundation

Project Experience

1. Role: Senior DevOps / Platform Engineer

Project Type: Blockchain-as-a-Service Platform · multi-region production RPC infrastructure

Projects / Applications Handled:

- EVM and UTXO blockchain node fleets — 50+ chain workloads
- L7 RPC gateway (HTTP, WebSocket, gRPC) with extAuth admission control
- Multi-region GitOps platform with progressive rollouts
- Internal service discovery + observability stack

Tools: Kubernetes (GKE), Docker, Helm, Kustomize, Terraform, Ansible, ArgoCD, Envoy Gateway, nginx, Consul, Prometheus, Grafana, Loki, GitLab CI, ZFS, GCP, OVH bare-metal

Responsibilities:

- Operate **50+ stateful workloads** on **Kubernetes (GKE)** and **bare metal** — covering full lifecycle from deployment to incident response.
- Design and implement **Kubernetes** manifests, **Helm** charts, and **Kustomize** overlays for stateful applications with persistent volume claims, snapshot-based rollback, and zero-downtime upgrade workflows.
- Author **Terraform** modules for GCP infrastructure — GKE clusters, networking (VPC, firewall, Global LB), IAM, secrets, and CSI storage provisioning.
- Build and maintain **GitOps** delivery using **ArgoCD ApplicationSets** with progressive multi-region rollouts (RollingSync), drift handling via `ignoreDifferences`, and documented runbooks for failure modes.
- Lead migration of platform-API and chain-RPC admission control from **nginx-Lua** to **Envoy Gateway** (Gateway API **HTTPRoute** + **SecurityPolicy** + `extAuth`) — preserving SLO budgets through traffic cutover.
- Operate and tune **ingress controllers** and L7 routing — Envoy Gateway data plane, nginx ingress, GCP Global Load Balancer, AutoNEG pod-NEG registration.
- Design **Consul**-based unified service discovery across Kubernetes, Nomad, and bare-metal — 60 members, 200+ service endpoints.
- Run **Prometheus** + **Grafana** + **Loki** observability stack with SLO-based alerting, dashboards-as-code workflow, and synthetic monitoring.
- Build and maintain **CI/CD** pipelines in **GitLab CI** — multi-stage builds, container image promotion, IaC plan/apply gates, and security scanning.
- Author **Python** tooling and **Bash** scripts for cluster operations — vitals snapshot CLI, MR-review knowledge automation, ZFS-snapshot rollback for stateful upgrades.
- Coordinate with engineering teams across security, product, and on-call for incident response, change reviews, and capacity planning.
- Operate in **US-time-shift** remote arrangement with a globally distributed team.

2. Role: Senior DevOps Engineer

Project Type: Healthcare EHR · cloud-native SaaS platform

Projects / Applications Handled:

- EHR application platform on AWS
- CI/CD bootstrap and observability foundation

Tools: AWS, Kubernetes (EKS), Docker, Helm, Jenkins (JCasC), Terraform, Ansible, Prometheus, Grafana, Loki, Git

Responsibilities:

- Sole DevOps engineer — took the platform from **no-CI / no-monitoring** to a working **IaC** and **observability** foundation.
- Designed and deployed **HA Jenkins on Kubernetes** via **JCasC** (Jenkins Configuration as Code) — fully declarative, version-controlled, reproducible.

- Introduced **Gitflow** branching, peer-review processes, and **Infrastructure as Code** as engineering practices across the team.
- Bootstrapped **Prometheus + Grafana + Loki** stack — first real observability the engineering team had.
- Authored **Terraform** modules for AWS infrastructure — EKS, VPC, RDS, IAM, ECR, and load balancers.
- Operated **Kubernetes** workloads on **EKS** — Helm-managed services, ingress controllers, network policies, RBAC.
- Designed **CI/CD** pipelines in **Jenkins** Groovy DSL — build, test, container image promotion, deploy gates.

3. Role: DevOps Engineer · Consultant

Project Type: Cloud Consulting · resilience & Kubernetes tooling engagements

Projects / Applications Handled:

- Chaos engineering POCs for client production platforms
- Kubernetes deployment-verification tooling
- Hot-reload configuration sidecar prototype

Tools: Kubernetes, Docker, Python, Consul, chaos-toolkit, Go, AWS, GCP

Responsibilities:

- Built **resiliency testing** capabilities using **chaos-toolkit** against production-grade clusters — failure injection and recovery validation.
- Designed a **Consul KV** sidecar POC for hot-reload configuration without restarting application pods.
- Authored **Python** tooling against the **Kubernetes API** for cluster-component health verification on deploy — automating manual smoke checks.
- Worked across **AWS** and **GCP** client environments — Terraform, Helm, and Kubernetes manifests.

4. Role: DevOps Engineer

Project Type: Enterprise SaaS · publishing & education platforms

Projects / Applications Handled:

- Org-wide CI/CD platform rollout
- Containerization and Kubernetes migration of legacy Java applications
- AWS infrastructure automation

Tools: Jenkins, Groovy, Docker, Kubernetes, AWS, CloudFormation, Ansible, Git, Bash, Python

Responsibilities:

- Part of the team introducing **DevOps practices** organization-wide — moving from manual deploys to automated, reproducible CI/CD.
- Built **Jenkins** pipelines in **Groovy DSL** — multi-branch, parameterized, with shared libraries reused across multiple application teams.

- Containerized legacy Java applications using **Docker** and orchestrated them on **Kubernetes**.
- Authored **AWS CloudFormation** templates for repeatable infrastructure provisioning across dev/staging/prod.
- Owned critical **CI/CD migrations** end-to-end — from legacy build systems to modern container-based pipelines.
- Coordinated with development teams to introduce **Git-based workflows**, peer review, and trunk-based development.
